

1.3.2

? Major Features

Docker Support (still in **beta**)

Previously the docker collector was a script that was ran (also through cron), now it's baked into the Agent binary file and therefore no need for a separate bash script. It also leverages the same credentials.yml which was introduced in 1.3.0. We have also added more information that is collected such as networks and volumes for a complete picture of your Docker environment.

Forced agent update button

You'll now find a button on the host page to force update the agent if it doesn't wish to update automatically.

UI themes to chose from

A few new branding Ui themes have been added allowing you to chose what theme to apply to PatchMons interface. This is currently app-wide and it requires that dark-mode is enabled for these themes to work.

Performance

Additional environment variables have been added relating to Database connections, these are all documented here : [Environment Documentation](#)

Metrics

We have introduced a metrics system, more information is found here about how our metrics collection works, what data is collected and opting in/out etc :

<https://docs.patchmon.net/books/patchmon-application-documentation/page/metrics-collection-information>

TFA / Backup Codes

Fixed TFA remember me not actually remembering Fixed Backup Codes entering, they can now be used in the same text box as the code itself

Fixes

1. Fixed Host timeout issue due to SSE connection issues on frontend
2. Fixed https go agent communication with server
3. Fixed Docker inventory collection
4. Fixed TFA and Backup Codes
5. Fixed not grouping by groups in the hosts table
6. IPv6 listening support added in Nginx config by community member @alan7000
7. When Deleting Groups it shows the hosts that are being affected

P.S I skipped 1.3.1 version tag because some members in the community have 1.3.1 when I was building it, if we release it as 1.3.1 then their agents won't really update properly - catering for the few.

Docker upgrade instructions video : https://www.youtube.com/watch?v=bi_r9aW2uQA **Written Instructions in docs** : <https://docs.patchmon.net/books/patchmon-application-documentation/page/upgrading-from-130-to-132>

For bare-metal type the `curl -fsSL -o setup.sh`
`https://raw.githubusercontent.com/PatchMon/PatchMon/refs/heads/main/setup.sh && chmod +x setup.sh`
`&& bash setup.sh --update` *should update your instance*

Many thanks to the community for their hard work and support. <3 iby__
